

# Predictive Model Report

## Classification Summary

Below is a breakdown of how well the model predicted your outcome of interest

Overall Accuracy

**80.9%**

48,707 out of 60,216 rows tested are classified correctly

[See accuracy details](#)

Performance for Not Applicable

**3.3x better than baseline**

Rows predicted to be Not Applicable are 3.27x more likely to be Not Applicable than the baseline rate.

Model Baseline

To identify the patterns in your data, we trained a custom machine learning model on 80% of your records and validated performance on the remaining 20%. Here's how well the model works.

### Predictive Performance

True Positives

2,569/10,778

**24%**

The model correctly predicted 2,569 of the 10,778 rows in the test set where Main\_Cause is Not Applicable

False Positives

1,815/49,438

**4%**

It incorrectly predicted 1,815 of the remaining 49,438 rows as Not Applicable

True Negatives

47,623/49,438

**96%**

The model correctly predicted 47,623 of the 49,438 rows in the test set where Main\_Cause is not Not Applicable

False Negatives

8,209/10,778

**76%**

It incorrectly predicted 8,209 of the remaining 10,778 rows as not Not Applicable

### Performance Details

Outcome	Accuracy	Precision	Recall	F1 Score	Count
All outcomes	80.9%	-	-	-	60,216
Not Applicable	-	0.59	0.24	0.34	10,778
Human Error	-	0.83	0.96	0.89	47,807
Vehicle Defect	-	0.19	0.01	0.02	1,412
Road Environment...	-	0.00	0.00	0.00	219
BUDDHISTS	-	0.00	0.00	0.00	0

**Accuracy** measures how often a prediction is correct. It is calculated by dividing the number of correct predictions by the total number of predictions.

[+ See More](#)

### Advanced Model Details

Different models are compared and the highest quality snapshot is returned at the end of training.

LOSS GRAPH

The blue line shows the average loss over time, and the shaded regions represent the range of loss values during each training step. A lower loss value means that the model is performing better.

MODEL TYPE

**Multilayer Neural Network**

A baseline neural network that can learn non-linear relationships between inputs and outputs efficiently. This model is a good starting point for most problems.

TRAINED

## OTHER MODELS TESTED

Model Type	Trial	Training Loss	Training Accuracy	Validation Loss	Validation Accuracy
Multi-layer Neural Network	--	0.007654	82.57%	0.031106	82.59%
Linear Regression	--	0.000349	80.18%	0.000313	83.15%

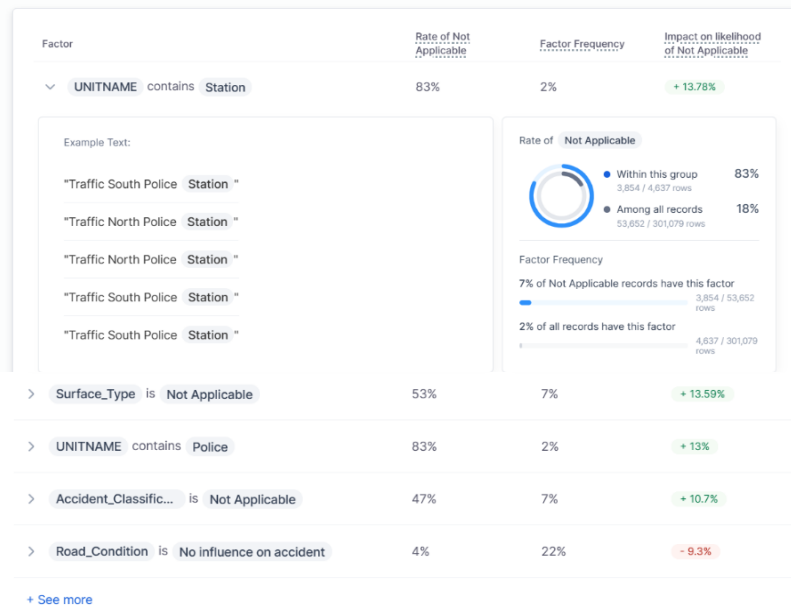

## Top Fields

Fields ranked by their contribution to the prediction results

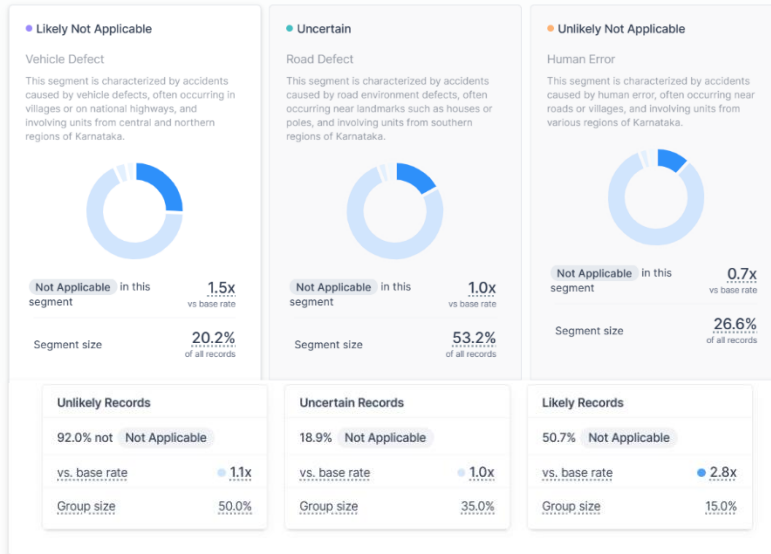

## Top Factors

Individual factors ranked by their contribution to the prediction results

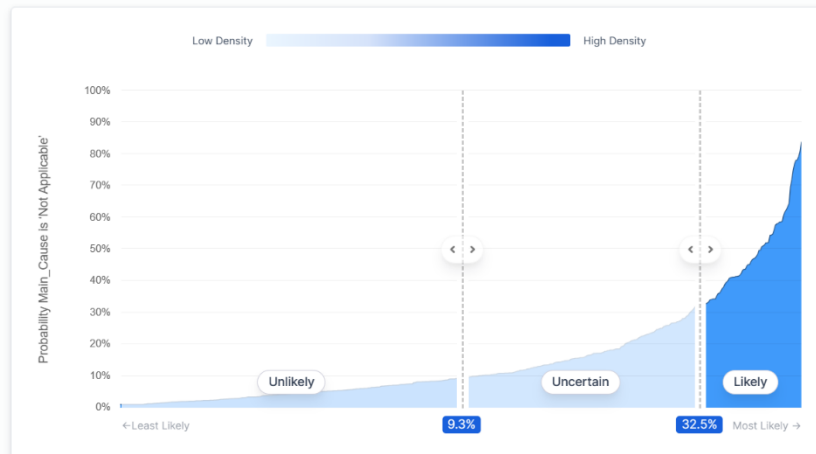

## Segments

Sets of similar records in your dataset grouped by outcome of interest

## Decision Threshold Graph

A subset of your data sorted by outcome of interest probability. Use this to explore decision thresholds.

### Sample Rows

Sample rows of your data sorted by outcome of interest probability. Drag the slider to inspect rows with different likelihoods.

Likely Records: Probability of **Not Applicable** is 80%

← Least Likely

Hide Summary

Refresh

The histogram of the "severity" column reveals the distribution of different levels of accident severity. This chart provides insights into the frequency of accidents based on their impact, allowing the user to identify vulnerable groups like pedestrians or cyclists. By understanding the severity distribution, the user can analyze the risk factors and develop targeted interventions to improve road safety.

### Bar Chart

This chart displays the distribution of main causes of road accidents.

Download

Hide Summary

Refresh

The chart description of the Bar Chart: (main\_cause) provides the distribution of the main causes of road accidents. By analyzing this chart, users can gain insights into the most common reasons for accidents. This information is crucial as it helps prioritize interventions and awareness campaigns to address the identified causes effectively.
